

Full Stack Engineer - Home Assignment

You will write a web application that shows information about a business entry like the business' name, address and opening hours.

Backend service REST API

You must provide a backend service that provides the data about "places" (business entries) for the UI and offers it as a REST API to the web application. Only the GET method entry point is required.

See the attached json file as example.

The properties `label`, `location` and `opening_hours` will provide you the needed information. Feel free to adapt the API if it doesn't fit your need.

Web application

Write a web application that displays at least the following details about a place (e.g. a restaurant):

- name
- address
- opening hours

The information about the place is fetched from a backend REST service that you'll write by providing an id of the place. The result could look like this:

Le Café du Marché Rue de Conthey 17, 1950 Sion	Opening Hours <table><tr><td>Monday</td><td>closed</td></tr><tr><td>Tuesday - Friday</td><td>11:30 - 15:00</td></tr><tr><td></td><td>18:30 - 00:00</td></tr><tr><td>Saturday</td><td>18:00 - 00:00</td></tr><tr><td>Sunday</td><td>11:30 - 15:00</td></tr><tr><td></td><td>^</td></tr></table>	Monday	closed	Tuesday - Friday	11:30 - 15:00		18:30 - 00:00	Saturday	18:00 - 00:00	Sunday	11:30 - 15:00		^
Monday	closed												
Tuesday - Friday	11:30 - 15:00												
	18:30 - 00:00												
Saturday	18:00 - 00:00												
Sunday	11:30 - 15:00												
	^												

Days with the same opening hours are grouped together (like "Tuesday - Friday" in the example).

Feel free to make it look nicer by using a different styling or additional data from the json you'll load from the upstream API.

Sum up

You must use Angular 13+ for the web app and spring boot for the backend service.

Please provide us your web app and backend service in a zip file or as a link to a github repository (preferred)

Do not spend more than 3 hours on this task.

Good luck and have fun!
